## Offer 3 – Digital Workers

There are endless things to discover about robotics. A lot of that is too fantastic for people to believe. Just as Bill Gates predicted a PC for every person. We estimate that each individual and organization is going to have, not one, but multiple robots in the form of digital workers:

1. Optimizing the cost of your idea.
2. Maximizing its potential.

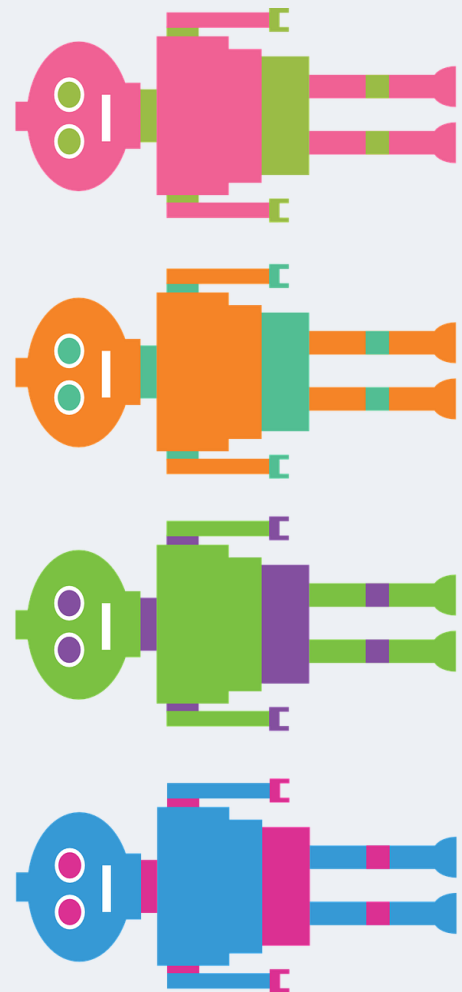

Our proposal is to offer you 3 robots or digital workers.

Workers capable of:

- Generate contenido
- Maintain communications
- Serve the customer online
- Reminders

The way the robotics market is going to grow is that we will have several different special purpose robots.

*With this tool,* you increase the competitiveness of your business and shorten or even eliminate the waiting times typical of most traditional business models.

# Create more...

# Work less.

This plan is designed for ideas that need to be enhanced and remove some repetitive tasks that are necessary.

*Bots* are used to automate certain processes, meaning they can operate autonomously, without specific instructions from humans. An organization or an individual can use a *bot* to replace a repetitive task that would otherwise have to be performed by a human. *Bots* are also much faster at these tasks than humans.

Redefining what productive work is, as more and more jobs are being replaced by automation, robotics, and artificial intelligence.

Countries with the highest density of robots also have the lowest unemployment rates. The right mix of technologies and humans will drive prosperity

---

## Success Stories

The advantages we have found in our success stories have saved time for our customers and their users. Available 24/7, bots are customizable and that improves the user experience being in most cases faster than humans:
